The present sequence is the coding sequence for a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. The protein produced from this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          180

These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to Ahranic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as embling structural studies of the protease and
                Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C

```
pestivirus genome where the Npro protease gene is replaced with NS3 protease gene, useful for in vivo screening of compounds which inhibit HCV infection
```

Example 2; Columns 17-28; 20pp; English.

The present invention relates to a nucleic acid construct encoding a colmaric Hepatitis C virus (HCV)-pestivitus genome. The construct comprises a pestivitus genome where a Npro pestivitus protease gene is replaced with a gene encoding a functional HCV NS3 protease. Furthermore, each junction site recognised by the Npro protease is replaced with a for screening compounds that Inhibit HCV in vivo by inhibiting HCV for screening compounds that Inhibit HCV in vivo by inhibiting HCV the present sequence is a chimaric colone of BVDV (bovine viral diarrhea virus)/HCV NS3-wt, which was used to illustrate the present invention.

HCV; hepatitis C virus; single chain recombinant complex; linker; NS3 protease; NS4A cofactor; NS4A-NS3 complex; serine protease; hydrophobic domain; covalent complex; detection; inhibitor; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex comprising a central hydrophobic domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker sequence encodes an example of the above complex. The present NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors by the protease activity and the APPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CyslleAsnGlyValCysTrpThrValTyrHisGlyAlaGlyThrArgThrIleAlaSer 81
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              42 AsnGlnValGluGlyGluValGlnIleValSerThrAlaThrGlnThrPheLeuAlaThr 61

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 beride protease domain, where the hydrophobic domain of native HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS3 protease domain. The present to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NAR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         162 AlaGlyHisAlaValGlyIlePheArgAlaAlaValCysThrArgGlyValAlaLysAla 181
                                                                                                                                                                                                                                                                The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A periodes domain, where the hydrophobic domain of native HCV NS3 berine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors by the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.

The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 earlie protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NWR spectroscopy. They can also be used for detecting inhibitors by the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         22 AlaGlnGlnThrArgGlyGluGluGlyCysGlnGluThrSerGlnThrGlyArgAspLys 41

comprising a toxin molety operatively incorporated into a substrate domain specific for a viral enzyme. This prototoxophore may be bound and modified by the viral enzyme. This prototoxophore may be bound coffect of an antiviral agent, this method comprises contacting a cell, infected with a virus or is susceptible to infection, with a prototoxophore. The invention further comprises an assay to identify afteriviral agents, comprising confacting an infected cell with a candidate agent and comparing the ability of the agent to inhibit the candidate agent and comparing the ability of the agent to inhibit the comparing the virus in the cell. The prototoxophores of the invention may have virucide or antitumour activity. The prototoxophores of the invention may be useful for reducing or inhibiting viral infectivity, by contacting a cell (e.g. lymphocyte, or expected with a virus or is susceptible to infection with a virus, with a reflective amount of the prototoxophore. The prototoxophore is also useful for ameliorating the severity of a viral infection in a subject, where the virus is selected from human immunodeficiency virus (HIV), herpes simplex virus (HVV), rhinovirus and hepatitis virus, by administering an effective amount of the prototoxophore to the subject. The prototoxophores of the invention are also useful for reading the severity of a virus prototoxophore to the subject. The prototoxophores of the invention are also useful for treating tumours. The present sequence represents an antiviral prototoxophore associated DNA sequence, this sequence is the invention although it is clearly not a protein agence of the invention and the invention and the present of a prototox prototor of the companient of the present of a prototox prototor and prototox prototor associated DNA sequence, this sequence is the invention all prototox brane of the present of a protein of a protein associated by protein in a subject. 439 CIGTCGCCCCGGCCCATTTCCTACTTGAAAGCTCCTCGGGGGGTCCGCTGTTGTGCCCC 498 139 AACCAAGTGGAGGTGAGGTCCAGATTGTGTCAACTGCTGCCCAAACCTTCCTGGCAACG 198 121 141 AlaGlyHisalaValGlyIlePheArgAlaAlaValCysThrArgGlyValAlaLysAla 181 ProLysGlyProValThrGlnMetTyrThrAsnValAspLysAspLeuValGlyTrpGln 101 LeuSerProArgProlleSerTyrLeuLysGlySerSerGlyGlyProLeuLeuCysPro 161 78 19 GGTAGTGTGGTCATTGTGGGTAGGATCATTTTGTCCGGTAGTGGTAGTATCACGGCGTAC 102 AlaProGlnGlySerArgSerLeuThrProCysThrCysGlySerSerAspLeuTyrLeu 122 ValThrArgHisAlaAspValIleProValArgArgArgGlyAspSerArgGlySerLeu 42 AsnGlnValGluGlyGluValGlnIleValSerThrAlaThrGlnThrPheLeuAlaThr the invention although it is clearly not a protein sequence Sequence 612 BP; 120 A; 171 C; 191 G; 130 T; 0 other; 612 178 3 11 11 Length: Matches: Conservative: Mismatches: Indels: US-09-965-594-16 (1-197) x ABX15706 (1-612) 7.89e-76 904.50 92.82% 91.28% 87.65% Percent Similarity: Best Local Similarity: Alignment Scores: 142 162 82 Query Match: DB: ò q ò g ò d à g 8 q õ a ò a à d

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 berihe protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence encodes an example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors by the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the noncovalent protease-peptide complexes previously available.

GENERAL INFORMATION:
APPLICANT: Witterfind, Michael
APPLICANT: Witterfind, Michael
APPLICANT: Shang, Yaqun
APPLICANT: Coldfarb, Vabentina
APPLICANT: Goldfarb, Vabentina
TITLE OF INVENTION: Facilitating Inhibitor Screening and Structural Studies
TITLE OF INVENTION: Protease:Inhibitor Complexes
TITLE OF INVENTION: US/09/965,594
CURRENT APPLICATION NUMBER: US/09/965,594
CURRENT APPLICATION NUMBER: 60/115,271
PRIOR FILING DATE: 1999-01-08
NUMBER OF SEQ ID NOS: 26
NUMBER OF SEQ ID NOS: 26

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /SIDSI/gcdata/geneseq/geneseqp-embl/AA1980.DAT:*

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of the two proteins should be effective as chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A well as enabling structural studies of the protease and proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helix0-7 ö 121 LVTRHADVIPVRRRGDSRGSLLSPRPISYLKGSSGGPLLCPAGHAVGIFRAAVSTRGVAK 180 9 Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C 1 MKKKGSVVIVGRINLSGDTAYAQQTRGEEGCQETSQTGRDKNQVEGEVQIVSTATQTFLA 61 TSINGVLWTVYHGAGTRTIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLY Hepatitis, NS3 protease, viral replication, chronic liver disease; liver failure, liver cancer; mutant; mutein. ö Length 197; Indels Goldfarb V; Score 1005; DB 21; Pred. The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                      The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NG3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of the two proteins should be effective as antiviral treatments of the two proteins should be effective as chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NG3 mutants and NG3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helix0-1

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helixo-Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis CTSINGVLWTVYHGAGIRIIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLY LVTRHADVIPVRRRGDSRGSLLSPRPISYLKGSSGGPLLCPAGHAVGIFRAAVSTRGVAK 1 MKKKGSVVIVGRINLSGDTAYAQQTRGEEGCQETSQTGRDKNQVEGEVQIVSTATQTFLA Hepatitis; NS3 protease; viral replication; chronic liver disease; liver failure; liver cancer; mutant; mutein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                    The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the WCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease. This sequence contains the alpha-helix0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                          The present sequence is a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 MKKKGSVVIVGRINLSGDTAYAQQTRGEEGCQETSQTGRDKNQVEGEVQIVSTATQTFLA

                                                                                                                                                                                          The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 estine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          62 SINGVLWTVYHGAGTRIIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLIPCTCGSSDLYL 121

The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NNR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the Arpasa activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.

                                                                                                                                                                       NSAA PERIOR COMPISSION OF CENTRAL HYDROPHOBIC domain of native HCV NSAA peptide, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NSAA peptide is tethered by the linker to the amino terminus of the HCV NSAA peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NSAA-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by Protease activity, the helicase activity and the ATPase activity of NS3. The covalent NSAA-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   22 GSVVIVGRIILSGSGSITAYSQQTRGLLGCKITSLTGRDKNQYBGEVQVVSTATQSFLAT 81

                                                                                                                                          NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 aperide. Ws4A peptide. A a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NNR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the Arpase activity of NS3 The covalent NS4A-NS3 complexes are more soluble, stable and active than

                                                                                                          The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex. Infact, and an HCV NS3 Serine procease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NNR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the Arpase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           VTRHADVIPVRRRGDSRGSLLSPRPISYLKGSSGGPLLCPAGHAVGIFRAAVSTRGVAKA 181

                                                                                   The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker sequence represents a specifically claimed example of the above complex. The covalent NS4A NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity and the ATPase activity of NS3 The covalent NS4A-NS3 complexes are more soluble, stable and active than

NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the Arpase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                           present invention describes a covalent hepatitis C virus (HCV)

```
As note: this sequence is inconsistent with the nucleotide translation
A;Note: this sequence is inconsistent with the nucleotide translation
A;Note: the authors translated the codon AGG for residue 43 as Pro, TGG for residue 3
as Trp, and Trc for residue 771 as Ser
A;Note: sequence extracted from NCBI backbone (NCBIN:121747, NCBIP:121748)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A.Molecule type: genomic RNA
A.Residues: 2650-2707 <AR2>
C.Superfamily: hepatitis C virus genome polyprotein
C.Superfamily: hepatitis C virus genome polyprotein
C.Superfamily: hepatitis C virus genome polyprotein
F.2.115/Product: capsid protein C *status predicted <ARE>
F.2.115/Product: major envelope protein E *status predicted <ARE>
F.300-723/Product: major envelope protein NS2 *status predicted <ARE>
F.300-723/Product: nonstructural protein NS2 *status predicted <ARS>
F.1007-1615/Product: hepacivirin *status predicted <ARS>
F.1312-1317/Region: uncleotide-binding motif R (P-loop)
                                                                                                                                                                                                                                 genome polyprotein - hepatitis C virus (strain J)
N; Contains: capsid protein C; envelope protein M; major envelope protein E; nonstructura
protein NS4a; nonstructural protein NS4b; nonstructural protein NS5
C; Species: hepatitis C virus
C; Species: hepatitis C virus
C; Species: hepatitis C virus
C; Accession: A39253; PS6086

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CATALYTIC ACTIVITY: Hydrolygis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1.

CATALYTIC ACTIVITY: Nucleoside triphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.
-!- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE ACTIVATION OF NS3.
-!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
-!- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN ESSENTIAL ROLE IN THE VIRUS REPLICATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;

-1-SUBUNT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.
